# Get Inspired

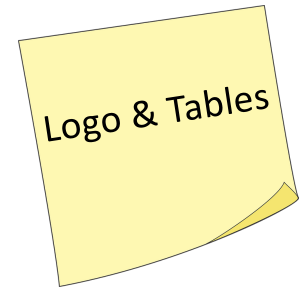

Introduction

- You don't need to start from scratch
- Look at other people's websites – especially those you admire and those which are successful
- Get ideas – look at their layout, the content they include, etc.
- Then, slowly, but surely...try and develop your own similar website
- Who knows, maybe one day people will be looking to your website as their example of what they aspire to!

**ACADEMY**

# Making and Inserting a Logo

- `<h1></h1>` is a Large Heading Tag – this can be used to insert a text header. The good part about using this is that it is easy and also searchable by Google. However, it lacks elegance, it lacks that special *joie de vivre*
- Make use of tables to arrange your page and easily position your logo (see previous section on tables)
- [www.freelogodesign.org](http://www.freelogodesign.org) is one example of an online site you can use to design a free logo.
- Also check out [canva.com](http://canva.com) – or simply design your own in a graphics package – you can even do it in PowerPoint.
- Make sure the logo is saved as an png/jpg and stored in the same folder as the html files
- Use `` to insert your logo

# Adding Free Images

Pixabay &  
Images

- It's important to be legal
- While there are many great images on the web many are copyrighted
- [www.pixabay.com](http://www.pixabay.com) - This website has a huge amount of free-to-use images
- Use `<td>` to insert your image into a table
- Use `` to put a place holder for where you want your image to appear

# Add A Background

- A Background is a great way of making your site seem more interesting
- Care needs to be made that the image chosen is a repeating image
- On Pixabay.com select “Backgrounds/Textures” – these are good for repeating images
- `<body background=“image.png”>` - Use the attribute “background” to specify the image you want to use
